1 Introduction

Hello, Cao! Welcome to your professional matching report! In this document, you'll find solidly researched information on your compatibility with 873 different career paths.

Our state-of-the-art psychometric models and questionnaires were developed using publicly available data from the Bureau of Labor Statistics (BLS) and the Occupational Information Network (ONET). This database consists in a set of 161 job characteristics, such as entry level of education, required skills, abilities and other competencies (rated from 0 to 1), as well as typical job activities, job hazards, and so on.

One of our goals at Atlas Research® is to determine the career that best fits your professional profile. Therefore, we assess your most important competencies and job preferences, and compare these with the 873 occupations we've gathered from the BLS and ONET. Then, we arrange your professional matches best to worst and estimate a compatibility score as a percentage, indicating your similarity to each occupation.

Don't forget to register at <https://www.go2atlas.com/> to view more detailed reports and gain access to our Mentorship Program. We hope you obtain value from this report. Have a great day!

2 Professional Compatibility Curve

Figure 1: Note: dsds

In the figure above, you can see your professional compatibility curve. This plot features, on the horizontal axis, your career matches ranked lowest to highest based on your professional compatibility score (on the vertical axis). Your best match is 'Chief Executives', with 70.67% compatibility; and the worst is 'Baggage Porters and Bellhops', with 0%. The median match is 'Geodetic Surveyors', with 38.54% compatibility, below which lies 50% of careers. Thus, it is evident that your range of recommended occupations is extremely narrow, covering 20 of our 873-occupations database.

The slope of the curve indicates how spread apart is your professional profile. If the curve is flat, then all values are identical. And as the angle increases to 45 degrees, each observation becomes entirely unique. Statistically, we can assess how dispersed is the compatibility curve by calculating the variance of your compatibility scores. In addition, the skewness of the curve tells us if your profile is more restricted to a few niche occupations or if it is less defined. By doing these calculations, we find you have somewhat left-skewed and varied matching percentages across all occupations. This means your professional profile is not too specialized, and you can likely thrive in a few different career paths, all else being equal.
